# "else" statement added so that when user inputs incorrectly, there is
# feedback.
# Example for "while" function below.
# Example:  i = 1
#           while i < 2:
#               print(i)
#               i += 1
#           else:
#               print("i is less than 3")
# The "while" statement creates a loop that executes a specified statement if
# the condition stated is true. I learned this information from
# "developer.mozilla.org."
# The "+" function adds 1 to the variable, "i".
# Example for the "%"(modulus) operator shown below.
# Example:      18 % 4
# The "%"(modulus) operator divides left hand operand by right hand operand
# and returns the remainder. The remainder of 18 / 4 is 2.
